# yubico

Welcome to the Yubico Family!

We're excited to help you improve your online security with YubiKeys through our Secure it Forward program

The keys support the two cutting edge authentication protocols: FIDO U2F and FIDO2. FIDO authentication is the only method proven to protect against phishing and man-in-the-middle attacks 100% of the time, and is already built into hundreds of your favorite applications like Google, Apple ID, Facebook, Twitter and Dropbox, allowing your YubiKey to work right out of the box.

How to get started with your YubiKey

To get started, head to yubico.com/start, select the type of YubiKey you've received, and you'll be shown a complete list of services (with instructions) that are compatible with the key. Your digital world is now secured!

Best practices for stronger account security

1. Turn on multi-factor authentication on all of your accounts that offer it.
   Tip: Try to use a YubiKey as your backup method and if that's not an option, look into a secure authenticator app and keep your backup codes in a safe place.

2. Use a password manager and secure your password vault with a YubiKey.
   Tip: Password managers that support YubiKeys include: 1Password, Dashlane, Bitwarden and more.

3. If you're using Gmail, enroll in their Advanced Protection program.
   Tip: It will require security keys, so use your YubiKey here!

4. If you're using Microsoft products, the YubiKey works here as well!
   Tip: Check out their AccountGuard program.

5. If you're using Cloudflare, the YubiKey works here as well!
   Tip: Check out their Project Galileo program.
